

Introducing the Hinge Health Enso

Groundbreaking wearable technology for lasting pain relief

The Hinge Health Enso has the most advanced technology for electrical nerve stimulation. In the past, non-invasive forms of electrical stimulation delivered low-frequency impulses that provided limited pain relief. In contrast, high-frequency pulse devices deliver more immediate and long-lasting relief, but historically required surgical implantation. Enso, being both high-frequency and non-invasive, is a proprietary breakthrough and is currently delivering non-addictive pain relief within seconds for thousands of members.

The most complete Digital MSK Clinic now includes Enso

By adding Enso into the Hinge Health core digital experience, members will have access to immediate pain relief that is both non-addictive and non-invasive. Moreover, employers and health plans that offer Hinge Health's Digital MSK Clinic will be providing their population with the most thorough, effective, and proven MSK solution available. By integrating Enso, Hinge Health is again bolstering its capabilities to drive the best outcomes and highest cost savings for employers.
